

(a) Step 1: A set of view rays ($\boldsymbol{\varsigma}_{g_{f,c}}$) are computed for each c surface point using the limits of the $\mathcal{C}$-space $\mathcal{C}_3$.
Step 2: The occluding points ($\boldsymbol{q}_f^{occl,\kappa}$) of a rigid body are found using ray casting.

(b) Step 3: The occlusion rays ($\boldsymbol{\varsigma}_{g_{f,c}}^{occl,\kappa}$) are computed between each c surface point and all occlusion points ($\boldsymbol{q}_f^{occl,\kappa}$).
Step 4: Select an additional point (${}^*\boldsymbol{q}_f^{occl,k}$) at each occlusion ray beyond the constrained space.

(c) Step 5: The occlusion space is characterized using the convex hull spanned by all colliding points and the additional points lying at the occlusion rays.
